Understanding the characteristics of material contact and lubrication at tribological interfaces is of great importance to engineering researchers and machine designers. Traditionally, contact and lubrication are separately studied due to technical difficulties, although they often coexist in reality and they are actually on the same physical ground. Fast research advancements in recent years have enabled the development and application of unified models and numerical approaches to simulate contact and lubrication, merging their studies into the domain of Interfacial Mechanics. This book provides updated information based on recent research progresses in related areas, which includes new concepts, theories, methods, and results for contact and lubrication problems involving elastic or inelastic materials, homogeneous or inhomogeneous contacting bodies, using stochastic or deterministic models for dealing with rough surfaces. It also contains unified models and numerical methods for mixed lubrication studies, analyses of interfacial frictional and thermal behaviors, as well as theories for studying the effects of multiple fields on interfacial characteristics. The book intends to reflect the recent trends of research by focusing on numerical simulation and problem solving techniques for practical interfaces of engineered surfaces and materials. This book is written primarily for graduate and senior undergraduate students, engineers, and researchers in the fields of tribology, lubrication, surface engineering, materials science and engineering, and mechanical engineering.

The Journal of Character Education is the only professional journal in education devoted to character education. It is designed to cover the field—from the latest research to applied best practices. We include original research reports, editorials and conceptual articles by the best minds in our field, reviews of the latest books, and other relevant strategies and manuscripts by educators that describe best practices in teaching and learning related to character education. The Journal of Character Education has for over a decade been the sole scholarly journal focused on research, theory, measurement, and practice of character education. This issue includes a "Voices" section highlighting the 2017 Character.org "Sandy Award" recipient, along with four peer-reviewed articles, and a book review.

The mobile app as technique and imaginary tool, offering a shortcut to instantaneous connection and entertainment. Mobile apps promise to deliver (h)appiness to our devices at the touch of a finger or two. Apps offer gratifyingly immediate access to connection and entertainment. The array of apps downloadable from the app store may come from the cloud, but they attach themselves firmly to our individual movement from location to location on earth. In *The Imaginary App*, writers, theorists, and artists—including Stephen Wolfram (in conversation with Paul Miller) and Lev Manovich—explore the cultural and technological shifts that have accompanied the emergence of the mobile app. These contributors and interviewees see apps variously as “ a machine of transcendence, ” “ a hulking wound in our nervous system, ” or “ a promise of new possibilities. ” They ask whether the app is an object or a relation, and if it could be a “ metamedium ” that supersedes all other artistic media. They consider the control and power exercised by software architecture; the app's prosthetic ability to enhance certain human capacities, in reality or in imagination; the app economy, and the divergent possibilities it offers of making a living or making a fortune; and the app as medium and remediator of reality. Also included (and documented in color) are selected projects by artists asked to design truly imaginary apps, “ icons of the impossible. ” These include a female sexual arousal graph using Doppler images; “ The Ultimate App, ” which accepts a payment and then closes, without providing information or functionality; and “ iLuck, ” which uses GPS technology and four-leaf-clover icons to mark places where luck might be found. Contributors Christian Ulrik Andersen, Thierry Bardini, Nandita Biswas Mellamphy, Benjamin H. Bratton, Drew S. Burk, Patricia Ticineto Clough, Robbie Cormier, Dock Currie, Dal Yong Jin, Nick Dyer-Witthof, Ryan and Hays Holladay, Atle Mikkola Kjøsen, Eric Kluitenberg, Lev Manovich, Vincent Manzerolle, Svitlana Matviyenko, Dan Mellamphy, Paul D. Miller aka DJ Spooky That Subliminal Kid, Steven Millward, Anna Munster, Søren Bro Pold, Chris Richards, Scott Snibbe, Nick Srnicek, Stephen Wolfram

This timely book offers rare insight into the field of cybersecurity in Russia -- a significant player with regard to cyber-attacks and cyber war. *Big Data Technologies for Monitoring of Computer Security* presents possible solutions to the relatively new scientific/technical problem of developing an early-warning cybersecurity system for critically important governmental information assets. Using the work being done in Russia on new information security systems as a case study, the book shares valuable insights gained during the process of designing and constructing open segment prototypes of this system. Most books on cybersecurity focus solely on the technical aspects. But *Big Data Technologies for Monitoring of Computer Security* demonstrates that military and political considerations should be included as well. With a broad market including architects and research engineers in the field of information security, as well as managers of corporate and state structures, including Chief Information Officers of domestic automation services (CIO) and chief information security officers (CISO), this book can also be used as a case study in university courses.
