Infrared (IR) spectroscopy is a simple, rapid, and nondestructive instrumental technique that can give evidence for the presence of various functional groups. If you had a sample of unknown identity, among the first things you would do is obtain an infrared spectrum, along with determining its solubility in common solvents and its melting and/ or boiling point.

In addition to the complex instrumental techniques (UV, IR, N M R and mass spectroscopy), chromatographic methods are also included here. The latter technique requires in certain instances, very simple equipment (column, paper, thin-layer, ion exchange and gel chromatography), and in other instances complex instruments are applied (gas chromatography and high performance liquid chromatography).

During this period significant contributions to analytical chemistry include the development of systematic elemental analysis by Justus von Liebig and systematized organic analysis based on the specific reactions of functional groups. The first instrumental analysis was flame emissive spectrometry developed by Robert Bunsen and Gustav Kirchhoff who discovered rubidium (Rb) and caesium (Cs) in 1860.
