Chapter 10 - Reaction Rates and Chemical Equilibrium. Section 10. -Rates of Reactions. Goal:Learn how temperature, concentration, and catalysts affect the rate of reaction. Summary. - The rate of a reaction is the speed at which the reactants are converted to products.

Chapter 10 Reaction Rates and Chemical Equilibrium

Reaction Rates and Equilibrium continued An enzyme is a large molecule that has one region on its surfaces called the active site. Only a particular sub- strate can fit into the active site of a particular enzyme. Only a substance that can fit into this active site can participate in a reaction catalyzed by the enzyme.

Reaction Rates And Equilibrium Section Review Answers

Increasing the temp, increases the reaction rate. Also changes the constant. Pressure of the reactants-If the pressure increases, the reaction rate does too. Gases are highly affected by temperature. Presence of an inhibitor-The reaction rate decreases because inhibitors increase the amount of activation energy necessary for a reaction.

Reaction Rates and Equilibrium Flashcards | Quizlet

The study of reaction rates is closely related to the study of reaction mechanisms, where a reaction mechanism is a theory that explains how a reaction occurs. 5.1: Chemical Kinetics We can distinguish two levels of detail in a chemical reaction mechanism: The first is the series of elementary processes that occurs for a given net reaction.

Equilibrium only means equal rates of reaction, not equal concentrations The Equilibrium Position is the relative concentrations of reactants and products at equilibrium It tells you which reaction is more likely to take place If a mixture is 1 % A and 99 % B, then the formation of B is favored, yet f the mixture is 99% A

Chapter 18: Reaction Rates and Equilibrium

Describe the relative sizes of the forward and reverse rates at equilibrium. Explain what effects whether the equilibrium position favors the products or the reactants. Predict how addition of a reactant or product will affect the forward and reverse reaction rates, and once this new system reaches equilibrium how the reactant and product ...

In the forward reaction, molecules go from reactant molecules to product molecules. There is a rate associated with this process. In the reverse reaction, the product molecules go to the reactants at another rate. At equilibrium, the rate of the forward and the reverse reactions are equal.
